

Home Cabling

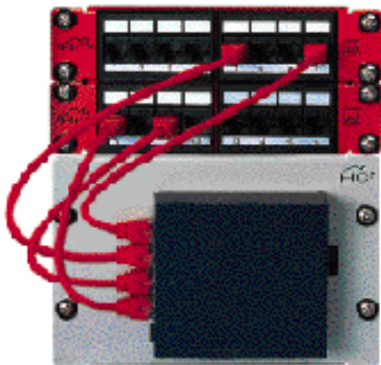

Home networking

Multi-room networking for telephone, computer, and TV (including video and satellite)

Computer Networking

Your HomeCabling system when complete with a 4 port computer hub will allow you to network 4 computers together. Situated above the hub there are 2 red

panels, these panels are wired back to your computer outlets located in different rooms around your home.

By using the red patch leads provided

you can patch from the hub to the red panels above. Only the ports connected with the red leads will be active, thus creating your home network.

As an option you can include an ISDN Access Server which permits multi user access to the Internet at any one time. It also includes, and therefore replaces, the 4 port hub.

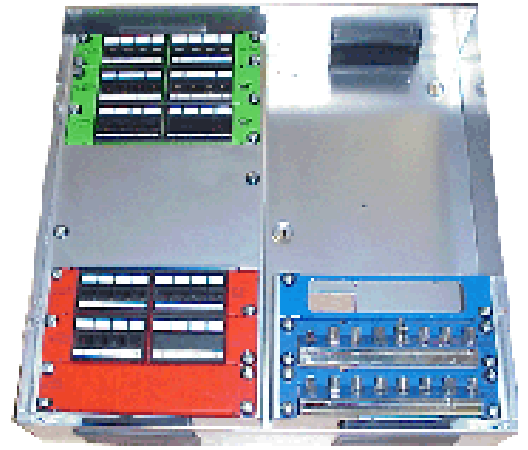

Telephone Networking

A connection is made, using the supplied patch lead from the standard BT telephone socket into the rear of the

host panel. The host panel is specially configured on the rear when it is manufactured, to provide 4 extensions from one BT line.

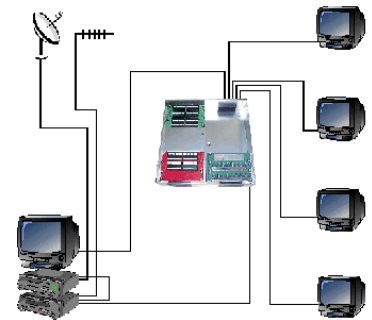

These telephone extensions can then be plugged into

designated ports on your user panel with the patching leads supplied.

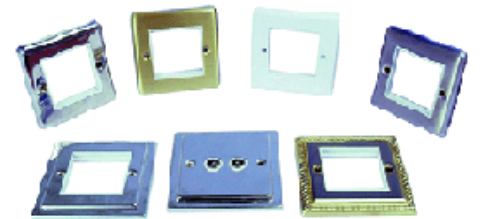

TV Networking

6 Televisions may be connected

together with the standard system to distribute video, cable/satellite and CCTV to any TV in the house.

The standard unit includes the capability for IR 'pass through'. This means that by adding a remote control IR receiver on top of each TV and putting a base receiver near the TV/

VCR/digibox, full control of those devices is available to the remote TV watcher.

Wall outlets
